

ARC FLASH PROTECTION RETROFIT KITS

With today's electrical standards and regulations, anytime that you open any boiler equipment control panel the boiler operator requires arc flash protection equipment and training.

We have developed a retrofit kit which allows your staff to view the program screen of the boiler in operation and if a failure occurs, the program can be reset without the need to open the control panel. Increasing safety and saving time.

Please call our Service Department for more details.

GAUGE GLASS PROTECTION

A quick heads up to our customers – TSSA is requiring that all gauge glass mountings on your steam boiler equipment must be protected by a cover. This modification does not take a long time, though some measurements do need to occur prior to the alteration taking place. We can easily add the cover when we are performing your Annual Service.

If you would like more information, please call our Service Department.
